# **CURVE FITTING**

#### **CONTENTS**

- n degree polynomial fitting
- Euler-Lagrange equation
- Minimum jerk trajectory (MJT) generation
- Quintic polynomial
- Lagrange polynomials
- Lagrange first-order, second-order, and nth-order interpolation
- Spline interpolation: Linear, Quadratic, and Cubic Spline
- Other types of curve fitting: Gradient descent, Double arc trajectory interpolation
- Nonlinear curve fitting
- Minimum-snap curve fitting
- Bezier curve fitting
- B-spline curve fitting

The least-squares method can be used to fit nth order fitting

■ Consider a set  $(x_i, y_i)$ , i = 0, ..., m-1

The least-squares method can be used to fit nth order fitting

- Consider a set  $(x_i, y_i)$ , i = 0, ..., m-1
- Define *nth* order fitting curve

$$a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n$$

The least-squares method can be used to fit *nth* order fitting

- Consider a set  $(x_i, y_i)$ , i = 0, ..., m-1
- Define *nth* order fitting curve

$$a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n$$

Convert to mean square error

$$J(x,y) = \sum_{i=0}^{m-1} (a_0 + a_1 x_i + a_2 x_i^2 + \dots + a_n x_i^n - y_i)^2$$

The least-squares method can be used to fit *nth* order fitting

- Consider a set  $(x_i, y_i)$ , i = 0, ..., m-1
- Define *nth* order fitting curve

$$a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n$$

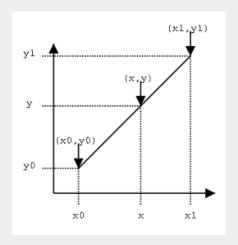

Convert to mean square error

$$J(x,y) = \sum_{i=0}^{m-1} (a_0 + a_1 x_i + a_2 x_i^2 + \dots + a_n x_i^n - y_i)^2$$

■ Solve it

$$A^{\top}A \begin{bmatrix} a_0 \\ a_1 \\ \dots \\ a_n \end{bmatrix} = A^{\top} \begin{bmatrix} y_1 \\ y_2 \\ \dots \\ y_m \end{bmatrix}, A = \begin{bmatrix} 1 & x_1 & \dots & x_1^n \\ 1 & x_2 & \dots & x_2^n \\ \vdots & \vdots & \ddots & \vdots \\ 1 & x_m & \dots & x_m^n \end{bmatrix}$$

#### LINEAR INTERPOLATION

$$f(x) = f(x_0) + (x - x_0) \frac{f(x_0) - f(x_1)}{x_0 - x_1}$$
 (1)

#### **EULER-LAGRANGE EQUATION**

A **solution** of the **Euler-Lagrange** equation is called an **extremal** (minimum or maximum) of the **functional**. If Lagrangian  $L(x,\dot{x})$ depends only on first-order derivatives, a second-order equation of motion can be found where only two boundary conditions are required, e.g., the position of the vehicle at an initial and final time. Such a condition fixes the endpoint. However, if Lagrangian  $L(x,\dot{x},\ddot{x})$  depends on second-order derivatives, a fourth-order equation of motion can be found. Hence, it requires four boundary conditions and fixing the velocity (as well as the **position**) at the **initial** and **final** time. Euler-Lagrange equations for a Lagrangian  $L(x, \dot{x}, \ddot{x}, ...)$  are given by

$$\frac{\partial L}{\partial x} - \frac{d}{dt} \left( \frac{\partial L}{\partial \dot{x}} \right) + \dots + (-1)^n \frac{d^n}{dt^n} \left( \frac{\partial L}{\partial x^{(n)}} \right) = 0.$$
 (2)

#### **EULER-LAGRANGE EQUATION**

Consider the AGV moves between the two positions within the time interval T.

$$J = \int_0^T Ldt \tag{3}$$

where T is the motion duration and the performance index is L, the minimum jerk trajectory for unconstrained point-to-point movement, is

$$L = \left(\frac{\partial^3 x}{\partial t^3}\right)^2 + \left(\frac{\partial^3 y}{\partial t^3}\right)^2 \tag{4}$$

where, x and y indicates the position components. The objective is to deduce the local path minimizing the cost function J.

Jerk is the time derivation of acceleration. Jerk is the way to define comfortness mathematically (or suppressing vibration effects or sudden acceleration change). Additionally, the first and second derivatives are continuous, so continuous velocity and curvature are satisfied.

■ To solve this, Euler-Lagrange equation can be utilized.

$$\frac{\partial L}{\partial x} - \frac{d}{dt} \left( \frac{\partial L}{\partial \dot{x}} \right) + \dots + (-1)^n \frac{d^n}{dt^n} \left( \frac{\partial L}{\partial x^{(n)}} \right) = 0, 
\frac{\partial L}{\partial y} - \frac{d}{dt} \left( \frac{\partial L}{\partial \dot{y}} \right) + \dots + (-1)^n \frac{d^n}{dt^n} \left( \frac{\partial L}{\partial y^{(n)}} \right) = 0.$$
(5)

■ To solve this, Euler-Lagrange equation can be utilized.

$$\frac{\partial L}{\partial x} - \frac{d}{dt} \left( \frac{\partial L}{\partial \dot{x}} \right) + \dots + (-1)^n \frac{d^n}{dt^n} \left( \frac{\partial L}{\partial x^{(n)}} \right) = 0, 
\frac{\partial L}{\partial y} - \frac{d}{dt} \left( \frac{\partial L}{\partial \dot{y}} \right) + \dots + (-1)^n \frac{d^n}{dt^n} \left( \frac{\partial L}{\partial y^{(n)}} \right) = 0.$$
(5)

■ Since jerk has to be minimized,  $\frac{d}{dt} \left( \frac{\partial \vec{x}^2}{\partial \vec{x}} \right) = 0$  and  $\frac{d}{dt} \left( \frac{\partial \vec{y}^2}{\partial \vec{y}} \right) = 0$  must be satisfied[1]. Hence,

$$\frac{d^6x}{dt^6} = 0, \quad \frac{d^6y}{dt^6} = 0 \tag{6}$$

■ To solve this, Euler-Lagrange equation can be utilized.

$$\frac{\partial L}{\partial x} - \frac{d}{dt} \left( \frac{\partial L}{\partial \dot{x}} \right) + \dots + (-1)^n \frac{d^n}{dt^n} \left( \frac{\partial L}{\partial x^{(n)}} \right) = 0, 
\frac{\partial L}{\partial y} - \frac{d}{dt} \left( \frac{\partial L}{\partial \dot{y}} \right) + \dots + (-1)^n \frac{d^n}{dt^n} \left( \frac{\partial L}{\partial y^{(n)}} \right) = 0.$$
(5)

■ Since jerk has to be minimized,  $\frac{d}{dt} \left( \frac{\partial \vec{x}^2}{\partial \vec{x}} \right) = 0$  and  $\frac{d}{dt} \left( \frac{\partial \vec{y}^2}{\partial \vec{y}} \right) = 0$  must be satisfied[1]. Hence,

$$\frac{d^6x}{dt^6} = 0, \quad \frac{d^6y}{dt^6} = 0 \tag{6}$$

■ Therefore, x(t) and y(t) must having the 5th order polynomial as follows:

$$x(t) = a_0 + a_1 t + a_2 t^2 + a_3 t^3 + a_4 t^4 + a_5 t^5$$

$$y(t) = b_0 + b_1 t + b_2 t^2 + b_3 t^3 + b_4 t^4 + b_5 t^5$$
(7)

#### QUINTIC POLYNOMIAL

A polynomial of degree five defines a quintic function.

$$x(t) = a_0 + a_1 t + a_2 t^2 + a_3 t^3 + a_4 t^4 + a_5 t^5$$

$$y(t) = b_0 + b_1 t + b_2 t^2 + b_3 t^3 + b_4 t^4 + b_5 t^5$$
(8)

Consider the initial condition  $x_0, y_0, \dot{x}_0, \dot{y}_0, \ddot{x}_0, \ddot{y}_0$  at t = 0 and final condition  $x_f, y_f, \dot{x}_f, \dot{y}_f, \ddot{x}_f, \ddot{y}_f$  at t = T are given.

**Quintic polynomial curve** fitting **decouples** the along **x** and **y** directions, however, **position, velocity acceleration and jerk** are solved by **coupling**.

#### QUINTIC POLYNOMIAL

Hence,

$$a_{0} = x_{0}, \quad a_{1} = \dot{x}_{0}, \quad a_{2} = \ddot{x}_{0}/2$$

$$A = \begin{bmatrix} t^{3} & t^{4} & t^{5} \\ 3t^{2} & 4t^{3} & 5t^{4} \\ 6t & 12t^{2} & 20t^{3} \end{bmatrix}, \quad b = \begin{bmatrix} x_{f} - a_{0} - a_{1} - a_{2}t^{2} \\ \dot{x}_{f} - a_{1} - 2a_{2}t \\ \ddot{x}_{f} - 2a_{2} \end{bmatrix}$$

$$\begin{bmatrix} a_{3} \\ a_{4} \\ a_{5} \end{bmatrix} = A^{-1}b$$

$$(9)$$

similar way  $b_0,...,b_5$  can be calculated. The higher-order derivatives can be estimated as follows:

$$x(t) = a_0 + a_1 t + a_2 t^2 + a_3 t^3 + a_4 t^4 + a_5 t^5$$

$$\dot{x}(t) = a_1 + 2a_2 t + 3a_3 t^2 + 4a_4 t^3 + 5a_5 t^4$$

$$\ddot{x}(t) = 2a_2 + 6a_3 t + 12a_4 t^2 + 20a_5 t^3$$
(10)

■ Given a set of points:  $(x_0, y_0), (x_1, y_1), ..., (x_n, y_n) \in \mathbb{R}^2$ , to define a Lagrange polynomial, it is required to define a set of cardinal functions:  $l_1, l_2, ..., l_n \in \mathbb{P}^n$  such that

$$l_i(x_j) = \delta_{ij} = \begin{cases} 1, & i = j \\ 0, & i \neq j \end{cases}$$
 (11)

for  $\forall i \in [0,...,n]$ . Term  $\delta_{ij}$  is called Kronecker's delta.

■ Given a set of points:  $(x_0, y_0), (x_1, y_1), ..., (x_n, y_n) \in \mathbb{R}^2$ , to define a Lagrange polynomial, it is required to define a set of cardinal functions:  $l_1, l_2, ..., l_n \in \mathbb{P}^n$  such that

$$l_i(x_j) = \delta_{ij} = \begin{cases} 1, & i = j \\ 0, & i \neq j \end{cases}$$
 (11)

for  $\forall i \in [0,...,n]$ . Term  $\delta_{ij}$  is called Kronecker's delta.

 $\blacksquare$  Term  $\mathbb{P}^n$ , denoted polynomial of nth order.

$$l_{i}(x) = \prod_{j=0, j \neq i}^{n} \left( \frac{x - x_{j}}{x_{i} - x_{j}} \right)$$

$$= \frac{x - x_{0}}{x_{i} - x_{0}} \cdot \frac{x - x_{1}}{x_{i} - x_{1}} \dots \frac{x - x_{n}}{x_{i} - x_{n}}$$
(12)

Both conditions:  $l_i(x_i) = 1$  and  $l_i(x_k) = 0$ ,  $i \neq k$  can be verified.

■ Therefore, the Lagrange form of a polynomial interpolation can be defined as

$$P_n(x) = \sum_{i=0}^n l_i(x) \cdot y_i \tag{13}$$

■ Therefore, the Lagrange form of a polynomial interpolation can be defined as

$$P_n(x) = \sum_{i=0}^n l_i(x) \cdot y_i \tag{13}$$

■ With that interpolation property is expressed as

$$P_n(x_j) = \sum_{i=0}^n l_i(x_j) \cdot y_i = y_j$$
 (14)

■ Formulate a second-order Lagrange polynomial that goes through these points: x, y = (0,1), (2/3,0.5), (1,0).

- Formulate a second-order Lagrange polynomial that goes through these points: x, y = (0,1), (2/3,0.5), (1,0).
- Define cardinal functions  $l_0(x)$ ,  $l_1(x)$ ,  $l_2(x)$ , afterwards Lagrange polynomial can be determined as

$$p_2(x) = l_0(x)y_0 + l_1(x)y_1 + l_2(x)y_2$$
 (15)

- Formulate a second-order Lagrange polynomial that goes through these points: x, y = (0,1), (2/3,0.5), (1,0).
- Define cardinal functions  $l_0(x)$ ,  $l_1(x)$ ,  $l_2(x)$ , afterwards Lagrange polynomial can be determined as

$$p_2(x) = l_0(x)y_0 + l_1(x)y_1 + l_2(x)y_2$$
 (15)

■ The main disadvantage of the Lagrange polynomial is that adding or removing a new point, it has to recompute all the  $l_i's$ 

# LAGRANGE FIRST ORDER INTERPOLATION AND SECOND ORDER INTERPOLATION

Lagrange first-order interpolation

$$f(x) = f(x_0) + (x - x_0) \frac{f(x_0) - f(x_1)}{x_0 - x_1}$$

$$= \frac{x - x_1}{x_0 - x_1} f(x_0) + \frac{x - x_0}{x_1 - x_0} f(x_1)$$
(16)

# LAGRANGE FIRST ORDER INTERPOLATION AND SECOND ORDER INTERPOLATION

■ Lagrange first-order interpolation

$$f(x) = f(x_0) + (x - x_0) \frac{f(x_0) - f(x_1)}{x_0 - x_1}$$

$$= \frac{x - x_1}{x_0 - x_1} f(x_0) + \frac{x - x_0}{x_1 - x_0} f(x_1)$$
(16)

Lagrange second-order interpolation

$$f(x) = f(x_0) + (x - x_0) \frac{f(x_0) - f(x_1)}{x_0 - x_1} + (x - x_0)(x - x_1) \frac{f(x_0, x_1) - f(x_1, x_2)}{x_0 - x_1}$$

$$= \frac{(x - x_1)(x - x_2)}{(x_0 - x_1)(x_0 - x_2)} f(x_0) + \frac{(x - x_0)(x - x_2)}{(x_1 - x_0)(x_1 - x_2)} f(x_1)$$

$$+ \frac{(x - x_0)(x - x_1)}{(x_2 - x_0)(x_2 - x_1)} f(x_2)$$
(17)

#### LAGRANGE NTH ORDER INTERPOLATION

$$f(x) = f(x_0)\delta_0(x) + f(x_1)\delta_1(x) + \dots + f(x_n)\delta_n(x)$$
(18)

where  $\delta_i(x)$  can be determined as

$$\delta_i(x) = \prod_{j=0, j \neq i}^n \left( \frac{x - x_j}{x_i - x_j} \right) \tag{19}$$

Some example: https://polympc.readthedocs.io/en/latest/ocp.html

#### Given

$$\min_{f:[0,1]\to\mathbb{R}} \int_0^1 \left[ f^{(2)}(t) \right]^2 dt$$
s.t.  $f(0) = a, f^{(1)}(0) = c$ 

$$f(1) = b, f^{(1)}(1) = d$$
(20)

■ The objective

$$J(f) = \int_0^1 \left[ f^{(2)}(t) \right]^2 dt$$

■ The objective

$$J(f) = \int_0^1 \left[ f^{(2)}(t) \right]^2 dt$$

■ After considering the perturbation

$$J(f,p) = \int_0^1 \left[ f^{(2)}(t) + h p^{(2)}(t) \right]^2 dt$$

■ The objective

$$J(f) = \int_0^1 \left[ f^{(2)}(t) \right]^2 dt$$

■ After considering the perturbation

$$J(f,p) = \int_0^1 \left[ f^{(2)}(t) + h p^{(2)}(t) \right]^2 dt$$

Gateaux derivative

$$dJ(f,p) = \frac{d}{dh} \left( \int_0^1 \left[ f^{(2)}(t) + h p^{(2)}(t) \right]^2 dt \right)_{h=0}$$
$$= \int_0^1 2 \left[ f^{(2)}(t) + h p^{(2)}(t) \right] p^{(2)}(t)|_{h=0} dt$$
$$= \int_0^1 2 f^{(2)}(t) p^{(2)}(t) dt$$

#### Variation of calculus to spline fitting

Taking integration by parts

$$dJ(f,p) = [2f^{(2)}(t)p^{(1)}(t)]_0^1 - [2f^{(3)}(t)p(t)]_0^1 + \int_0^1 2f^{(4)}(t)p(t)dt$$
$$= \int_0^1 2f^{(4)}(t)p(t)dt$$

If f(t) is optimal for the considered constraint problem, then dJ(f,p)=0 as long as , f(t)+hp(t) is feasible for small  $h\Rightarrow p(0)=p(1)=p^{(1)}(0)=p^{(1)}(1)=0$ . The function p(t) can have infinitely many forms. Therefore, to obtain dJ(f,p)=0,  $f^{(4)}(t)=0$ . Hence,  $f(t)=a^0+a^1t+a^2t^2+a^3t^3$ .

#### SPLINE: PIECE-WISE INTERPOLATION

**Only consider sub-interval** without considering the **whole polynomial** as formulated in Lagrange nth order interpolation. Let S(t) be interpolated function through a given set of points  $(t_i, y_i)_{i=0}^n$ . The ordered set  $t_0 < t_1 < ... < t_n$  is called knots vector. Hence, S(t) contains a set of piece-wise polynomials

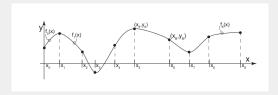

$$S(t) = \begin{cases} S_0(t), & t_0 \le t \le t_1 \\ S_1(t), & t_1 \le t \le t_2 \\ \vdots \\ S_{n-1}(t) & t_{n-1} \le t \le t_n \end{cases}$$
 (21)

S(t) is a polynomial of degree k, if and only if S(t) is k-1 times continuous differentiable

$$S_{i-1}(t_i) = S_i(t_i), S_{i-1}'(t_i) = S_i'(t_i), \dots S_{i-1}^{(k-1)}(t_i) = S_i^{(k-1)}(t_i), \qquad \text{(22)}$$

When n equals 1 linear Spline, equals 2 quadratic Spline, and equals 3 cubic spline

#### SPLINE: PIECE-WISE INTERPOLATION

In general,  $f(x_i) = a_i + b_i x + c_i x^2 + d_i x^3$ , is the function which depicts the curve in between  $i^{th}$  and  $i + 1^{th}$  control points[1]. Hence, each curve represents by a cubic polynomial, with four coefficients for each. How many parameters are to be solved?

[1]. https://people.cs.clemson.edu/~dhouse/courses/405/notes/splines.pdf

#### SPLINE: PIECE-WISE INTERPOLATION

Each segment pass through its control points  $f_i(x) = v_i$ ,  $f_i(x_{i+1}) = v_{i+1}$ 

Consecutive segments should have the same slop and same curvature where they join together  $f_i'(x_{i+1}) = f_{i+1}'(x_{i+1})$ ,  $f_{i}''(x_{i+1}) = f_{i+1}''(x_{i+1})$ 

How many parameters are to be solved?

#### LINEAR SPLINE

Piece-wise linear interpolation, i.e., straight-line. The constraints are

$$S_{0}(t_{0}) = y_{0}$$

$$S_{i-1}(t_{i}) = S_{i}(t_{i}) = y_{i}, \quad i = 1, 2, ..., n-1, \quad \Rightarrow S_{i}(t) = y_{i} + \frac{y_{i+1} - y_{i}}{t_{i+1} - t_{i}}(t - t_{i})$$

$$S_{n-1}(t_{n}) = y_{n}$$

$$(23)$$

#### **CUBIC SPLINE**

Given ordered set  $(t_i, y_i)_{i=0}^n$ , cubic spline can be defined as

$$S(t) = S_i(t) \quad for \quad t_i \le t \le t_{i+1} \tag{24}$$

where  $S_i(t) = d_i(t-t_i)^3 + c_i(t-t_i)^2 + b_i(t-t_i) + a_i, i = 0, 1, ..., n-1$ . Thus, the total number of unknown 4n. However, the following constraints must be satisfied S(t) is a polynomial of degree k=3, if and only if S(t) is k-1 times continuous differentiable

$$S_{i}(t_{i}) = y_{i}, S_{i}(t_{i+1}) = y_{i+1}, i = 0, 1, ..., n-1 \Rightarrow 2 \cdot n \text{ equations}$$

$$S'_{i}(t_{i+1}) = S'_{i+1}(t_{i+1}), i = 0, 1, ..., n-2 \Rightarrow n-1 \text{ equations}$$

$$S^{(2)}_{i}(t_{i+1}) = S^{(2)}_{i+1}(t_{i+1}), i = 0, 1, ..., n-2 \Rightarrow n-1 \text{ equations}$$

$$S^{(2)}_{0}(t_{0}) = 0, S^{(2)}_{n-1}(t_{n}) = 0 \Rightarrow 2 \text{ equations}$$

$$(25)$$

■ Consider  $z_i = S^{(2)}(t_i)$ , i = 1, 2, ..., n - 1,  $z_0 = z_n = 0$ . Since  $S^{(2)}$  are linear functions,  $S^{(2)}$  can be formulated in the Lagrange form

$$S_{i}^{(2)}(t) = \frac{z_{i+1}}{t_{i+1} - t_{i}} (t - t_{i}) - \frac{z_{i}}{t_{i+1} - t_{i}} (t - t_{i+1})$$

$$= \frac{z_{i+1}}{h_{i}} (t - t_{i}) - \frac{z_{i}}{h_{i}} (t - t_{i+1}),$$
(26)

where term  $h_i = t_{i+1} - t_i$ .

■ Consider  $z_i = S^{(2)}(t_i)$ , i = 1, 2, ..., n - 1,  $z_0 = z_n = 0$ . Since  $S^{(2)}$  are linear functions,  $S^{(2)}$  can be formulated in the Lagrange form

$$S_{i}^{(2)}(t) = \frac{z_{i+1}}{t_{i+1} - t_{i}} (t - t_{i}) - \frac{z_{i}}{t_{i+1} - t_{i}} (t - t_{i+1})$$

$$= \frac{z_{i+1}}{h_{i}} (t - t_{i}) - \frac{z_{i}}{h_{i}} (t - t_{i+1}),$$
(26)

where term  $h_i = t_{i+1} - t_i$ .

■ After integration, terms  $S_i'(t)$  and  $S_i(t)$  can be derived as follows:

$$S_{i}'(t) = \frac{z_{i+1}}{2h_{i}}(t-t_{i})^{2} - \frac{z_{i}}{2h_{i}}(t-t_{i+1})^{2} + C_{i} - D_{i}$$

$$S_{i}(t) = \frac{z_{i+1}}{6h_{i}}(t-t_{i})^{3} - \frac{z_{i}}{6h_{i}}(t-t_{i+1})^{3} + C_{i}(t-t_{i}) - D_{i}(t-t_{i+1})$$
(27)

Considering interpolating properties

$$S_{i}(t_{i}) = y_{i}, \Rightarrow y_{i} = -\frac{z_{i}}{6h_{i}}(-h_{i})^{3} - D_{i}(-h_{i}) \Rightarrow D_{i} = \frac{y_{i}}{h_{i}} - \frac{h_{i}}{6}z_{i}$$

$$S_{i}(t+1) = y_{i+1}, \Rightarrow y_{i+1} = \frac{z_{i+1}}{6h_{i}}(-h_{i})^{3} + C_{i}(-h_{i}) \Rightarrow C_{i} = \frac{y_{i+1}}{h_{i}} - \frac{h_{i}}{6}z_{i+1}$$

$$\Rightarrow y_{i+1} = a_{i+1} = a_{i} + b_{i}h_{i} + c_{i}h_{i}^{2} + d_{i}h_{i}^{3}$$

$$(28)$$

Considering interpolating properties

$$S_{i}(t_{i}) = y_{i}, \Rightarrow y_{i} = -\frac{z_{i}}{6h_{i}}(-h_{i})^{3} - D_{i}(-h_{i}) \Rightarrow D_{i} = \frac{y_{i}}{h_{i}} - \frac{h_{i}}{6}z_{i}$$

$$S_{i}(t+1) = y_{i+1}, \Rightarrow y_{i+1} = \frac{z_{i+1}}{6h_{i}}(-h_{i})^{3} + C_{i}(-h_{i}) \Rightarrow C_{i} = \frac{y_{i+1}}{h_{i}} - \frac{h_{i}}{6}z_{i+1}$$

$$\Rightarrow y_{i+1} = a_{i+1} = a_{i} + b_{i}h_{i} + c_{i}h_{i}^{2} + d_{i}h_{i}^{3}$$

$$(28)$$

 $\blacksquare$  Since D and C are known,

$$S_{i}(t) = \frac{z_{i+1}}{6h_{i}}(t - t_{i})^{3} - \frac{z_{i}}{6h_{i}}(t - t_{i+1})^{3} + (\frac{y_{i+1}}{h_{i}} - \frac{h_{i}}{6}z_{i+1})(t - t_{i})$$

$$-(\frac{y_{i}}{h_{i}} - \frac{h_{i}}{6}z_{i})(t - t_{i+1}) \quad (29)$$

$$S'_{i}(t) = \frac{z_{i+1}}{2h_{i}}(t - t_{i})^{2} - \frac{z_{i}}{2h_{i}}(t - t_{i+1})^{2} + \frac{y_{i+1} - y_{i}}{h_{i}} - \frac{z_{i+1} - z_{i}}{6}h_{i}$$

■ Continuity of S'(t) requires  $S'_{i-1}(t_i) = S'_i(t_i), i = 1, ..., n-1$ ,

$$S'_{i}(t_{i}) = -\frac{z_{i}}{2h_{i}}(-h_{i})^{2} + \underbrace{\frac{y_{i+1} - y_{i}}{h_{i}}}_{e_{i}} - \frac{z_{i+1} - z_{i}}{6}h_{i}$$

$$= -\frac{1}{6}h_{i}z_{i+1} - \frac{1}{3}h_{i}z_{i} + e_{i}$$

$$S'_{i-1}(t_{i}) = \frac{1}{6}h_{i-1}z_{i-1} + \frac{1}{3}h_{i-1}z_{i} + e_{i-1}$$
(30)

■ Continuity of S'(t) requires  $S'_{i-1}(t_i) = S'_i(t_i), i = 1, ..., n-1,$ 

$$S'_{i}(t_{i}) = -\frac{z_{i}}{2h_{i}}(-h_{i})^{2} + \underbrace{\frac{y_{i+1} - y_{i}}{h_{i}}}_{e_{i}} - \frac{z_{i+1} - z_{i}}{6}h_{i}$$

$$= -\frac{1}{6}h_{i}z_{i+1} - \frac{1}{3}h_{i}z_{i} + e_{i}$$

$$S'_{i-1}(t_{i}) = \frac{1}{6}h_{i-1}z_{i-1} + \frac{1}{3}h_{i-1}z_{i} + e_{i-1}$$
(30)

■ Also, 
$$S'_{i}(t_{i+1}) = S'_{i+1}(t_{i+1})$$
 and
$$S^{(2)}_{i}(t_{i+1}) = S^{(2)}_{i+1}(t_{i+1}), i = 0, ..., n-2,$$

$$\Rightarrow b_{i+1} = b_{i} + 2c_{i}h_{i} + 3d_{i}h_{i}^{2}$$

$$\Rightarrow c_{i+1} = 2c_{i} + 6d_{i}h_{i}$$
(31)

■ After setting them equal to each other,

$$\begin{cases} h_{i-1}z_{i-1}+2(h_{i-1}+h_i)z_i+h_iz_{i+1}=6(e_i-e_{i-1}), & i=1,2,...,n-1\\ & z_0=z_n=0 \end{cases} \tag{32}$$

■ After setting them equal to each other,

$$\begin{cases} h_{i-1}z_{i-1} + 2(h_{i-1} + h_i)z_i + h_iz_{i+1} = 6(e_i - e_{i-1}), & i = 1, 2, ..., n-1 \\ z_0 = z_n = 0 \end{cases}$$
(32)

■ However,  $z_i = S^{(2)}(t_i) = 2c_i$ 

$$\begin{cases} h_{i-1}c_{i-1} + 2(h_{i-1} + h_i)c_i + h_ic_{i+1} = 3(e_i - e_{i-1}), & i = 1, 2, ..., n-1 \\ z_0 = z_n = 0 \end{cases}$$
(33)

■ Here both  $h_i$  both  $e_i$  are known, only the  $\{c_i\}_{i=0}^n$  are unknown which can be solved by solving the following system of equations, where  $\mathbf{A}$  is a  $(n+1)\times(n+1)$  matrix and  $\mathbf{Az} = \mathbf{b}$ , in which  $\mathbf{A}$ 

$$\mathbf{A} = \begin{pmatrix} 2(h_0 + h_1) & h_1 & h_2 & h_2 \\ h_1 & 2(h_1 + h_2) & h_2 & & & \\ & h_2 & 2(h_2 + h_3) & h_3 & & \\ & \ddots & \ddots & \ddots & \\ & & h_{n-3} & 2(h_{n-3} + h_{n-2}) & h_{n-2} \\ & & & h_{n-2} & 2(h_{n-2} + h_{n-1}) . \end{pmatrix}$$

■ Here both  $h_i$  both  $e_i$  are known, only the  $\{c_i\}_{i=0}^n$  are unknown which can be solved by solving the following system of equations, where  $\mathbf{A}$  is a  $(n+1)\times(n+1)$  matrix and  $\mathbf{Az} = \mathbf{b}$ , in which  $\mathbf{A}$ 

$$\mathbf{A} = \begin{pmatrix} 2(h_0 + h_1) & h_1 \\ h_1 & 2(h_1 + h_2) & h_2 \\ h_2 & 2(h_2 + h_3) & h_3 \\ & \ddots & \ddots & \ddots \\ & & h_{n-3} & 2(h_{n-3} + h_{n-2}) & h_{n-2} \\ & & h_{n-2} & 2(h_{n-2} + h_{n-1}) \end{pmatrix}$$

■ However, after incorporating the boundary condition, i.e.,  $z_0 = S^{(2)}(t_i) = 2c_0 + 6d_0(t_0 - t_0) = 0 \Rightarrow c_0 = 0, c_n = 0.$ 

$$\mathbf{A} = \begin{pmatrix} 1 & 0 & h_1 & h_1 \\ h_0 & 2(h_0 + h_1) & h_1 & h_2 \\ & h_1 & 2(h_1 + h_2) & h_2 & & \\ & \ddots & \ddots & \ddots & \\ & & h_{n-2} & 2(h_{n-2} + h_{n-1}) & h_{n-1} \\ & & 0 & & 1 \end{pmatrix}$$

■ In general, **A** is tri-diagonal, symmetric, and diagonal dominant. i.e.,  $2|h_{i-1} + h_i| > |h_i| + |h_{i-1}|$ , which implies unique solution.

$$\mathbf{b} = \begin{pmatrix} \mathbf{0} \\ 3(e_1 - e_0) \\ 3(e_2 - e_1) \\ \vdots \\ 3(e_{n-2} - e_{n-3}) \\ 3(e_{n-1} - e_{n-2}) \\ \mathbf{0} \end{pmatrix}, \quad \mathbf{z} = \begin{pmatrix} c_0 \\ c_1 \\ c_2 \\ \vdots \\ c_{n-2} \\ c_{n-1} \\ c_n \end{pmatrix}$$

where  $e_{i+1} - e_i = \frac{1}{h_{i+1}}(a_{i+2} - a_{i+1}) - \frac{1}{h_i}(a_{i+1} - a_i), \forall i = 0,...,n$ .

■ In general, **A** is tri-diagonal, symmetric, and diagonal dominant. i.e.,  $2|h_{i-1} + h_i| > |h_i| + |h_{i-1}|$ , which implies unique solution.

$$\mathbf{b} = \begin{pmatrix} \mathbf{0} \\ 3(e_1 - e_0) \\ 3(e_2 - e_1) \\ \vdots \\ 3(e_{n-2} - e_{n-3}) \\ 3(e_{n-1} - e_{n-2}) \\ \mathbf{0} \end{pmatrix}, \quad \mathbf{z} = \begin{pmatrix} \mathbf{c_0} \\ c_1 \\ c_2 \\ \vdots \\ c_{n-2} \\ c_{n-1} \\ \mathbf{c_n} \end{pmatrix}$$

where  $e_{i+1} - e_i = \frac{1}{h_{i+1}}(a_{i+2} - a_{i+1}) - \frac{1}{h_i}(a_{i+1} - a_i), \forall i = 0,...,n$ .

■ Solving for  $d_i$  in eq.(31),

$$y_{i+1} = a_{i+1} = a_i + b_i h_i + \frac{h_i^2}{3} (2c_i + c_{i+1})$$

$$\Rightarrow b_i = \frac{1}{h_i} (a_{i+1} - a_i) - \frac{h_i}{3} (c_{i+1} + 2c_i),$$
(34)

## Example 02

A fit cubic spline that passes these points:  $(0,1),(1,e),(2,e^2),(3,e^3)$ 

### Example 02

A fit cubic spline that passes these points:  $(0,1),(1,e),(2,e^2),(3,e^3)$ 

$$\mathbf{A} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 1 & 4 & 1 & 0 \\ 0 & 1 & 4 & 1 \\ 0 & 0 & 0 & 1 \end{bmatrix}, \quad \mathbf{b} = \begin{bmatrix} 0 \\ 3(e^2 - 2e + 1) \\ 3(e^3 - 2e^2 + e) \\ 0 \end{bmatrix}, \quad \mathbf{z} = \begin{bmatrix} c_0 \\ c_1 \\ c_2 \\ c_3 \end{bmatrix}$$
(35)

Cubic splines are continuous and smooth at the connecting points.

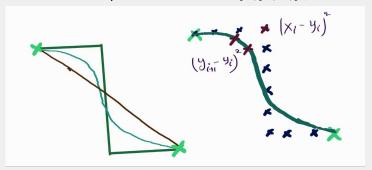

## OTHER TYPES OF CURVE FITTING

- B-Spline: can generate control commands without smoothing
- Bezier
- Minimum-span
- Dubins curve: can not generate control commands without smoothing

### **CURVE FITTING: GRADIENT DESCENT**

- Suppose the planner gives a set of planning points  $[x_1, x_2, ..., x_n]$
- $\blacksquare$  Smoothed a set of points to be found [ $y_1, y_2, ..., y_n$ ]

#### **CURVE FITTING: GRADIENT DESCENT**

■ By minimizing the following cost function

$$cost = \lambda_1 |x_i - y_i| + \lambda_2 |y_i - y_{i+1}|$$

where  $\lambda_1$  and  $\lambda_2$  are regularization parameters. When  $\lambda_1$  is larger than  $\lambda_2$ , the smooth point is closer to the original point, and vice versa, the smoother the path

■ The gradient descent to find the minimum value to the defined threshold value of the cost function

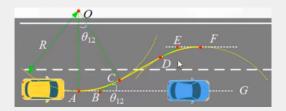

$$y_i = x_i, i = [0,...,n]$$

traverse except for the start and end point and update  $y_i$ 

$$y_i = y_i + \lambda_1(x_i - y_i) + \lambda_2(y_{i-1} - 2 \cdot y_i + y_{i+1})$$

CURVE FITTING: DOUBLE ARC TRAJECTORY INTERPOLATION

These types of trajectory fitting fit for turning and parking

## WHAT IS A TRAJECTORY

### A trajectory

$$p(t)=p_0+p_1t+p_2t^2+...+p_dt^d=\Sigma_{i=0}^dp_it^i=[1,t,t^2,..,t^d]\cdot p \ \ \mbox{(36)}$$
 where  $p=[p_0,p_1,...,p_d].$ 

<sup>[1].</sup> Mellinger D, Kumar V. Minimum snap trajectory generation and control for quadrotors[C]//Robotics and Automation (ICRA), 2011 IEEE International Conference on. IEEE, 2011: 2520-2525.

<sup>[2].</sup> Polynomial Trajectory Planning for Aggressive Quadrotor Flight in Dense Indoor Environments, Charles Richter, Adam Bry, and Nicholas Roy

### WHAT IS A TRAJECTORY

A trajectory

$$p(t) = p_0 + p_1 t + p_2 t^2 + \dots + p_d t^d = \sum_{i=0}^d p_i t^i = [1, t, t^2, \dots, t^d] \cdot p$$
 (36)

where  $p = [p_0, p_1, ..., p_d]$ .

■ Hence, at time t, position, velocity, acceleration, jerk, snap, etc, are calculated as

$$v(t) = p^{(1)}(t) = [0, 1, 2t, 3t^{2}, 4t^{3}, ..., dt^{d-1}] \cdot p$$

$$a(t) = p^{(2)}(t) = [0, 0, 2, 6t, 12t^{2}, ..., d(d-1)t^{d-2}] \cdot p$$

$$jerk(t) = p^{(3)}(t) = [0, 0, 0, 6, 24t, ..., \frac{d!}{(d-3)!}t^{d-3}] \cdot p$$

$$snap(t) = p^{(4)}(t) = [0, 0, 0, 0, 24, ..., \frac{d!}{(d-4)!}t^{d-4}] \cdot p$$
(37)

<sup>[1].</sup> Mellinger D, Kumar V. Minimum snap trajectory generation and control for quadrotors[C]//Robotics and Automation (ICRA), 2011 IEEE International Conference on. IEEE, 2011: 2520-2525.

## HIGHER-ORDER TRAJECTORY GENERATION

Let  $P_i(t)$  be the dth order polynomial in the ith segment that describes as follows:

$$P_{i}(t) = p_{i,0}t^{0} + p_{i,1}t^{1} + p_{i,2}t^{2} + \dots + p_{i,d}t^{d} = \begin{bmatrix} p_{i,0} & p_{i,1} & \dots & p_{i,d} \end{bmatrix} \begin{bmatrix} t^{0} \\ t^{1} \\ \vdots \\ t^{d} \end{bmatrix}.$$
(38)

 $P_i(t)$  provides a flat output for a given time index t for x, y, z, and yaw angle **independently** that is four-rotor drones and two-wheeled differential wheel robots (inaccurate simplification), their trajectories are independent on each axis.

$$p^{(4)}(t) = \sum_{i \ge 4} \frac{i!}{(i-4)!} t^{i-4} \cdot p_i$$

$$p(t) = p_0 + p_1 t + p_2 t^2 + \dots + p_d t^d = \sum_{i=0}^d p_i t^i$$

$$p^{(4)}(t) = \sum_{i \ge 4} \frac{i!}{(i-4)!} t^{i-4} \cdot p_i$$

$$p(t) = p_0 + p_1 t + p_2 t^2 + \dots + p_d t^d = \sum_{i=0}^d p_i t^i$$

$$\blacksquare p^{(4)}(t) = \sum_{i \ge 4} \frac{i!}{(i-4)!} t^{i-4} \cdot p_i$$

$$p(t) = p_0 + p_1 t + p_2 t^2 + \dots + p_d t^d = \sum_{i=0}^d p_i t^i$$

$$\blacksquare p^{(4)}(t) = \sum_{i \ge 4} \frac{i!}{(i-4)!} t^{i-4} \cdot p_i$$

$$J_{i} = \int_{T_{j-1}}^{T_{j}} \left(p^{(4)}(t)\right)^{2} dt$$

$$= \int_{T_{i-1}}^{T_{i}} \begin{bmatrix} p_{d} \\ p_{d-1} \\ \vdots \\ p_{0} \end{bmatrix}^{\top} \begin{bmatrix} \frac{d!}{(d-4)!} t^{d-4} \\ \vdots \\ 0 \\ 0 \\ 0 \end{bmatrix} \begin{bmatrix} \frac{d!}{(d-4)!} t^{d-4} \\ \vdots \\ p_{0} \end{bmatrix}^{\top} \begin{bmatrix} p_{d} \\ p_{d-1} \\ \vdots \\ p_{0} \end{bmatrix} = \begin{bmatrix} p_{d} \\ p_{d-1} \\ \vdots \\ p_{0} \end{bmatrix}^{\top}$$

$$\begin{bmatrix} \frac{d!}{(d-4)!} \frac{d!}{(d-4)!} \frac{(T_{i}-T_{i-1})^{d+d-7}}{d+d-7} & \frac{d!}{(d-4)!} \frac{d!}{((d-5)!)d} \frac{(T_{i}-T_{i-1})^{d+d-1-7}}{d+d-1-7} & \cdots \\ \vdots & \vdots & \vdots \\ \frac{j!}{(j-4)!} \frac{l!}{(l-4)!} \frac{(T_{i}-T_{i-1})^{j+l-7}}{j+l-7} & \cdots \\ \vdots & \vdots & \vdots \\ p_{0} \end{bmatrix}$$

$$\vdots & \vdots & \vdots \\ p_{0} \end{bmatrix}$$

$$=P_i^{\top}Q_iP_i$$

# THE OBJECTIVE FUNCTION WHEN d=5

In case, when using the 5th (d=  $3 \times 2 - 1$ ) order polynomial, requires minimizing the jerk, i.e.,  $J = \int_0^T \left(\frac{d^3 P(t)}{dt^3}\right)^2$ , whose 6 unknown parameters are to be found. Then, the corresponding Q matrix is as follows:

## THE OBJECTIVE FUNCTION

$$J = J_0 + J_1 + \dots + J_M = \sum_{m=0}^{M} P_m Q_m P_m$$

$$= \begin{bmatrix} P_0 \\ P_1 \\ \vdots \\ P_M \end{bmatrix}^{\top} \begin{bmatrix} Q_1 & \dots & 0 \\ 0 & \ddots & \vdots \\ 0 & \dots & Q_M \end{bmatrix} \begin{bmatrix} P_0 \\ P_1 \\ \vdots \\ P_M \end{bmatrix}$$

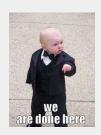

By optimising J the minimum value can be obtained.

## THE OBJECTIVE FUNCTION

$$J = J_0 + J_1 + \dots + J_M = \sum_{m=0}^{M} P_m Q_m P_m$$

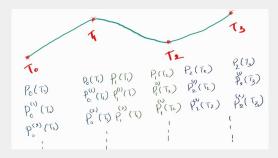

$$= \begin{bmatrix} P_0 \\ P_1 \\ \vdots \\ P_M \end{bmatrix}^\top \begin{bmatrix} Q_1 & \dots & 0 \\ 0 & \ddots & \vdots \\ 0 & \dots & Q_M \end{bmatrix} \begin{bmatrix} P_0 \\ P_1 \\ \vdots \\ P_M \end{bmatrix}$$

By optimising **J the minimum value** can be obtained.

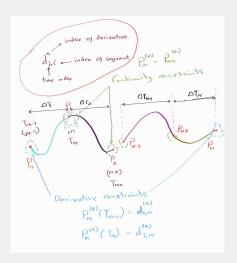

## THE OBJECTIVE FUNCTION

However, the result of the possible optimization is that the speed or acceleration between the intermediate points is not continuous. Hence, some additional constraints are needed to limit the continuity.

,2

- Time duration is known in advance, and it can be varied or fixed between segments
- Order of a polynomial d = 2l 1; l order of the optimization goal, e.g., snap minimization l=4

<del>-</del>3

#### ADDITIONAL CONSTRAINTS: CONTINUITY CONSTRAINTS

■ Let  $P_m(t)$  be the dth order polynomial in the mth segment that describes as follows:

$$P_m(t) = p_{m,0}t^0 + p_{m,1}t^1 + p_{m,2}t^2 + \dots + p_{m,d}t^d = \Sigma_{j=0}^d p_{m,j}t^j \quad \text{(39)}$$

#### ADDITIONAL CONSTRAINTS: CONTINUITY CONSTRAINTS

■ Let  $P_m(t)$  be the dth order polynomial in the mth segment that describes as follows:

$$P_m(t) = p_{m,0}t^0 + p_{m,1}t^1 + p_{m,2}t^2 + \dots + p_{m,d}t^d = \sum_{j=0}^d p_{m,j}t^j$$
 (39)

■ Hence, to preserve the **continuity**, higher-order derivatives must satisfy, k = 1,...,l (the highest order of derivative), for each of the **intermediate segments** 

$$P_m^{(k)}(T_m) = P_{m+1}^{(k)}(T_m)$$
 (40)

$$\Rightarrow \Sigma_{j\geq k} \frac{j!}{(j-k)!} T_m^{j-k} p_{m,j} - \Sigma_{r\geq k} \frac{r!}{(r-k)!} T_m^{r-k} p_{m+1,r} = 0$$

$$\Rightarrow \left[ A_m - A_{m+1} \right] \begin{bmatrix} P_m \\ P_{m+1} \end{bmatrix} = 0$$

$$(41)$$

CONSTRAINTS

**Differential constraints** are applied **start** and **end** points of each **segment**.

$$\begin{bmatrix} T_{m-1}^{d} & T_{m-1}^{d-1} & \dots & T_{m-1}^{0} \\ T_{m}^{d} & T_{m}^{d-1} & \dots & T_{m}^{0} \\ dT_{m-1}^{d-1} & (d-1)T_{m-1}^{d-2} & \dots & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ \dots & \frac{i!}{(i-k)!}T_{m-1}^{i-k} & \dots & \dots \end{bmatrix} \begin{bmatrix} p_{d} \\ p_{d-1} \\ \vdots \\ p_{0} \end{bmatrix} = \begin{bmatrix} \rho_{T_{m-1}} \\ \rho_{T_{m}} \\ v_{T_{m-1}} \\ v_{T_{m}} \\ a_{T_{m-1}} \\ a_{T_{m}} \\ \vdots \end{bmatrix}$$

$$\Rightarrow A_{m}P_{m} = d_{m}$$

$$(42)$$

#### **ADDITIONAL CONSTRAINTS**

After combining the continuity constraints and the differential constraints

$$\begin{bmatrix} A_0 & 0 & 0 & 0 & \dots & 0 \\ A_0 & -A_1 & 0 & 0 & \dots & 0 \\ 0 & A_1 & 0 & 0 & \dots & 0 \\ 0 & A_1 & -A_2 & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & 0 & 0 & A_M \end{bmatrix} \begin{bmatrix} P_0 \\ P_1 \\ P_2 \\ P_3 \\ \vdots \\ P_M \end{bmatrix} = \begin{bmatrix} d_0 \\ 0 \\ d_1 \\ 0 \\ \vdots \\ d_M \end{bmatrix}$$
(43)

## AS A CONSTRAINED QUADRATIC PROBLEM

$$\min \begin{bmatrix} P_{0} \\ P_{1} \\ \vdots \\ P_{M} \end{bmatrix}^{\top} \begin{bmatrix} Q_{1} & \dots & 0 \\ 0 & \ddots & \vdots \\ 0 & \dots & Q_{M} \end{bmatrix} \begin{bmatrix} P_{0} \\ P_{1} \\ \vdots \\ P_{M} \end{bmatrix} = P^{\top}QP$$

$$\text{s.t.} \begin{bmatrix} A_{0} & 0 & 0 & 0 & \dots & 0 \\ A_{0} & -A_{1} & 0 & 0 & \dots & 0 \\ 0 & A_{1} & 0 & 0 & \dots & 0 \\ 0 & A_{1} & -A_{2} & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & 0 & 0 & A_{M} \end{bmatrix} \begin{bmatrix} P_{0} \\ P_{1} \\ P_{2} \\ P_{3} \\ \vdots \\ P_{M} \end{bmatrix} = \begin{bmatrix} d_{0} \\ 0 \\ d_{1} \\ 0 \\ \vdots \\ d_{M} \end{bmatrix}$$

$$(44)$$

Since **constraints** are **equality** constraints, such constraints can be **converted** into the **cost function** through some mathematical methods, then it becomes an **unconstrained optimization** problem, and then it can be **solved in a closed manner**. The benefits of closed solving are **faster solving** speed and **higher numerical stability**.

#### MINIMUM-SNAP TRAJECTORY GENERATION

Let  $P_m(t)$  be the dth order polynomial in the mth segment that describes as follows:

$$P_m(t) = p_{m,0}t^0 + p_{m,1}t^1 + p_{m,2}t^2 + \dots + p_{m,d}t^d = \sum_{j=0}^d p_{m,j}t^j \qquad \text{(45)}$$

For **minimum-snap trajectory** is required to have **a derived seventh-order polynomial** 

$$P_{m}(t) = p_{m,0}t^{0} + \dots + p_{m,7}t^{7} = \sum_{j=0}^{7} p_{m,j}t^{j} = \begin{bmatrix} p_{m,0} & p_{m,1} & \dots & p_{m,7} \end{bmatrix} \begin{bmatrix} t^{0} \\ t^{1} \\ \vdots \\ t^{7} \end{bmatrix}$$

Each **polynomial** has **8 unknown** coefficients. Hence **position**, **speed**, **acceleration**, and **jerk** constraints (including both **differential** and **continuity** constraints) for the endpoints of the trajectory are required.

$$\begin{bmatrix} P_m(t) \\ P_m^{(1)(t)} \\ P_m^{(2)(t)} \end{bmatrix} = \begin{bmatrix} p_{m,5}t^5 & p_{m,4}t^4 & p_{m,3}t^3 & p_{m,2}t^2 & p_{m,1}t^1 & p_{m,0}t^0 \\ 5p_{m,5}t^4 & 4p_{m,4}t^3 & 3p_{m,3}t^2 & 2p_{m,2}t & p_{m,1} & 0 \\ 20p_{m,5}t^3 & 12p_{m,4}t^2 & 6p_{m,3}t^2 & 2p_{m,2} & 0 & 0 \end{bmatrix}$$
 
$$\begin{bmatrix} p_{m,5} \\ p_{m,5} \end{bmatrix}$$

$$=\begin{bmatrix} t^5 & t^4 & t^3 & t^2 & t^1 & t^0 \\ 5t^4 & 4t^3 & 3t^2 & 2t & 1 & 0 \\ 20t^3 & 12t^2 & 6t^2 & 2 & 0 & 0 \end{bmatrix} \begin{bmatrix} p_{m,5} \\ p_{m,4} \\ p_{m,3} \\ p_{m,2} \\ p_{m,1} \\ p_{m,0} \end{bmatrix}$$

# MINIMUM-JERK TRAJECTORY GENERATION: DIFFEREN-TIAL CONSTRAINTS

Consider the relative time, i.e., start from zero and end at T, for each segment,

$$P_m^{(k)}(T_m) = d_{T_m,j}^{(k)} \Rightarrow \Sigma_{j \ge k} \frac{j!}{(j-k)!} T_m^{j-k} p_{m,j}$$

and then

$$\begin{bmatrix} P(0) \\ P^{(1)}(0) \\ P^{(2)}(0) \\ P(T) \\ P^{(1)}(T) \\ P^{(2)}(T) \end{bmatrix} = \begin{bmatrix} 0^5 & 0^4 & 0^3 & 0^2 & 0^1 & 1 \\ 5 \cdot 0^4 & 4 \cdot 0^3 & 3 \cdot 0^2 & 2 \cdot 0 & 1 & 0 \\ 20 \cdot 0^3 & 12 \cdot 0^2 & 6 \cdot 0^2 & 2 & 0 & 0 \\ T^5 & T^4 & T^3 & T^2 & T^1 & T^0 \\ 5T^4 & 4T^3 & 3T^2 & 2T & 1 & 0 \\ 20T^3 & 12T^2 & 6T^2 & 2 & 0 & 0 \end{bmatrix} \begin{bmatrix} p_5 \\ p_4 \\ p_3 \\ p_2 \\ p_1 \\ p_0 \end{bmatrix}$$

$$\Rightarrow d_m = A_m P_m$$
$$\Rightarrow P_m = A_m^{-1} d_m$$

# MINIMUM-JERK TRAJECTORY GENERATION: CONTINUITY CONSTRAINTS

$$A_m = \begin{bmatrix} 0^d & 0^{d-1} & \dots & 0^2 & 0^1 & 1 \\ d \cdot 0^{d-1} & (d-1) \cdot 0^{d-2} & \dots & 2 \cdot 0^1 & 1 & 0 \\ d \cdot (d-1) \cdot 0^{d-2} & (d-1) \cdot (d-2) \cdot 0^{d-3} & \dots & 2 \cdot 1 \cdot 1 & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ T^d & T^{d-1} & \dots & T^2 & T^1 & T^0 \\ d \cdot T^{d-1} & (d-1) \cdot T^{d-2} & \dots & 2 \cdot T^1 & T^0 & 0 \\ d \cdot (d-1) \cdot T^{d-2} & (d-1) \cdot (d-2) \cdot T^{d-3} & \dots & 2 \cdot 1 \cdot T^0 & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \end{bmatrix}$$

$$\min \begin{bmatrix} P_0 \\ P_1 \\ \vdots \\ P_M \end{bmatrix}^{\top} \begin{bmatrix} Q_1 & \dots & 0 \\ 0 & \ddots & \vdots \\ 0 & \dots & Q_M \end{bmatrix} \begin{bmatrix} P_0 \\ P_1 \\ \vdots \\ P_M \end{bmatrix} = P^{\top}QP \tag{46}$$

$$\min \quad \underbrace{\begin{bmatrix} d_0 \\ d_1 \\ \vdots \\ d_M \end{bmatrix}}^{\top} \begin{bmatrix} A_0 & 0 & 0 & 0 & \dots & 0 \\ 0 & A_1 & 0 & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & 0 & A_M \end{bmatrix}^{-\top} \begin{bmatrix} Q_1 & \dots & 0 \\ 0 & \ddots & \vdots \\ 0 & \dots & Q_M \end{bmatrix}$$

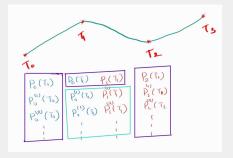

$$\begin{bmatrix} A_0 & 0 & 0 & 0 & \dots & 0 \\ 0 & A_1 & 0 & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & 0 & A_M \end{bmatrix}^{-1} \begin{bmatrix} d_0 \\ d_1 \\ \vdots \\ d_M \end{bmatrix}$$

$$\min \quad \mathbf{d}^{\top} A^{-\top} Q A^{-1} \mathbf{d}$$

$$(48)$$

The **differential constraints** have been brought into the **cost** function

Assume trajectory is defined from  $T_0$  to  $T_2$ 

The values of the variables  $d_{mf}$  in the purple box are all set in advance, and the variables  $d_{mp}$  in the light blue box are the optimal values assigned by the cost function during optimization, which are the variables that need to be optimized.

 $d_{mf}$  fixed derivatives at the start, the goal state and intermediate positions

 $d_{mp}$  free derivatives at all intermediate connections

## Considering a trajectory with two segments

Similar way, **the C matrix** can be generated for higher-order cases.

Due to the **nature of C**, the **continuity constraints** can be added into the **cost** function, because after using the C matrix, **equal variables are omitted** whose **values are equal**, consider

$$d_{mf} := d_F$$
 and  $d_{mp} := d_P$ 

$$J = \min \quad \begin{bmatrix} d_F \\ d_P \end{bmatrix}^{\top} C A^{-\top} Q A^{-1} C^{\top} \begin{bmatrix} d_F \\ d_P \end{bmatrix} = \min \quad \begin{bmatrix} d_F \\ d_P \end{bmatrix}^{\top} R \begin{bmatrix} d_F \\ d_P \end{bmatrix} \quad (49)$$

$$J = \min \begin{bmatrix} d_F \\ d_P \end{bmatrix}^{\top} R \begin{bmatrix} d_F \\ d_P \end{bmatrix} = \min \begin{bmatrix} d_F \\ d_P \end{bmatrix}^{\top} \begin{bmatrix} R_{FF} & R_{FP} \\ R_{PF} & R_{PP} \end{bmatrix} \begin{bmatrix} d_F \\ d_P \end{bmatrix}$$

$$= d_F^{\top} R_{FF} d_F + d_F^{\top} R_{FP} d_P + d_P^{\top} R_{PF} d_F + d_P^{\top} R_{PP} d_P$$
(50)

$$J = \min \quad \begin{bmatrix} d_F \\ d_P \end{bmatrix}^\top C A^{-\top} Q A^{-1} C^\top \begin{bmatrix} d_F \\ d_P \end{bmatrix} = \min \quad \begin{bmatrix} d_F \\ d_P \end{bmatrix}^\top R \begin{bmatrix} d_F \\ d_P \end{bmatrix} \quad \text{(51)}$$

The matrix Q is a symmetric matrix and J is a scalar, and  $CA^{-\top}QA^{-1}C^{\top} = \left(CA^{-\top}QA^{-1}C^{\top}\right)^{\top}$ . Hence, R must be a symmetric matrix. That is,  $R_{PF} = R_{FP}^{\top}$ . Therefore,

$$J = \min \begin{bmatrix} d_F \\ d_P \end{bmatrix}^{\top} \begin{bmatrix} R_{FF} & R_{FP} \\ R_{PF} & R_{PP} \end{bmatrix} \begin{bmatrix} d_F \\ d_P \end{bmatrix}$$

$$= d_F^{\top} R_{FF} d_F + d_F^{\top} R_{FP} d_P + d_P^{\top} R_{PF} d_F + d_P^{\top} R_{PP} d_P$$

$$= d_F^{\top} R_{FF} d_F + 2 d_F^{\top} R_{FP} d_P + d_P^{\top} R_{PP} d_P$$
(52)

The optimal value for  $d_P$  is determined as

$$J = d_F^{\top} R_{FF} d_F + 2 d_F^{\top} R_{FP} d_P + d_P^{\top} R_{PP} d_P$$

$$\frac{\partial J}{\partial d_P} = 2 d_F^{\top} R_{FP} + 2 R_{PP} d_P = 0$$

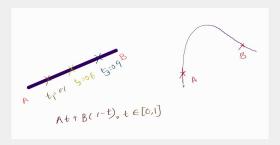

$$\Rightarrow d_P^* = -R_{PP}^{-1} R_{FP}^{\top} d_F$$
(53)

With that, the polynomial can be determined as

$$P = A^{-1}C^{\top} \begin{bmatrix} d_F \\ d_P^* \end{bmatrix}$$

## NONLINEAR CURVE FITTING

**B-splines** and **Bezier** curves can be used for nonlinear curve fitting

Track interpolation and smoothing, i.e., trajectory interpolation, Path to trajectory control output, i.e., calculate position, speed, and acceleration with respect to time

The fitted curve **must pass** through the **start** and the **endpoint**, and the curve must not pass through the **intermediate control point**.

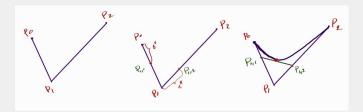

■ First-order curve: it's a linear interpolation based on t

$$B_1(t) = P_0 + (P_1 - P_0)t \Rightarrow B_1(t) = (1 - t)P_0 + tP_1, t \in [0, 1]$$

#### Second-order curve

- Select 3 non-collinear points in the plane and connect them sequentially by straight lines
- ► Select point  $P_{0,1}$  in the first line segment  $P_0P_1$ , and find the corresponding point  $P_{1,2}$  from the second line segment so that  $P_0P_{0,1}$ :  $P_0P_1 = P_1P_{1,2}$ : $P_1P_2$

$$P_{0,1} = (1-t)P_0 + tP_1$$
,  $P_{1,2} = (1-t)P_1 + tP_2$ 

■ Second-order curve

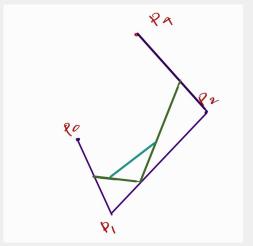

$$B_2(t) = (1-t)B_1(t)_{0,1} + tB_1(t)_{1,2} = (1-t)P_{0,1} + tP_{1,2}$$

■ Second-order curve

$$B_2(t) = (1-t)B_1(t)_{0,1} + tB_1(t)_{1,2} = (1-t)P_{0,1} + tP_{1,2}$$

$$\begin{split} B_2(t) = & (1-t)((1-t)P_0 + tP_1) + t((1-t)P_1 + tP_2) \\ = & (1-t)^2P_0 + 2t(1-t)P_1 + t^2P_2, t \in [0,1] \end{split}$$

■ Third-order curve

#### Bezier curve formula

$$\mathbf{B}(t) = \sum_{i=0}^{n} P_i B_{i,n}(t), \quad t \in [0,1]$$

$$B_{i,n}(t) = C_n^i t^i (1-t)^{n-i} = \frac{n!}{i!(n-i)!} t^i (1-t)^{n-i}, \ i=0,...,n$$

#### **Derivatives of Bezier curve**

The control points are independent, hence, the derivation is directly deriving t

$$\frac{d}{dt}B_{i,n}(t) = n(B_{i-1,n-1}(t) - B_{i,n-1}(t))$$

$$\frac{d}{dt}\mathbf{B}(t) = \sum_{i=0}^{n-1} \left( n(P_{i+1} - P_i) \right) B_{i,n-1}(t)$$

If 
$$\bar{P}_0 = n(P_1 - P_0), \bar{P}_1 = n(P_2 - P_1), ..., \bar{P}_{n-1} = n(P_n - P_{n-1})$$

$$\frac{d}{dt}\mathbf{B}(t) = \sum_{i=0}^{n-1} \bar{P}_i B_{i,n-1}(t)$$

#### still a Bezier curve

- Curve shape is determined by its control points, if there are n control points, Bezier is constructed in order of n-1
- Local changes are not allowed, whole curve will change
- The sum of the coefficients is one, i.e.,  $(t+(1-t))^n = 1^n$
- Recursion property

$$B_{i,n}(t) = (1-t)B_{i,n-1}(t) + tB_{i-1,n-1}(t), \quad i = 0, 1, ..., n$$

- Convex Hull property the Bezier curve will always be in the smallest convex polygon that contains all the control points
- The first and last control points are exactly the start and end points of the curve

- Let U be the set of non-decreasing numbers,  $u_0 \le u_1 \le ... \le u_m$  is called **knots**, the set U is called **knot vector**, and the half-open interval  $[u_i, u_{i+1})$  is the ith **knot interval** (knot span). When  $u_i$  is equal, a **uniform B-spline** is formed.
- For n+1 number of control points  $P_i$ , i=0,...,n connecting by m number of knots points, m=n+p+1, where p+1 order B-spline curve can e defined as

$$P(u) = \sum_{i=0}^{n} P_i N_{i,p}(u)$$

■ Cox-de Boor recursive formula [1]:

$$N_{i,0}(u) = \begin{cases} 1 & \text{if } u_i \leq u \leq u_{i+1} \\ 0 & \text{otherwise} \end{cases}$$
 
$$N_{i,p}(u) = \frac{u - u_i}{u_{i+p} - u_i} N_{i,p-1}(u) + \frac{u_{i+p+1} - u}{u_{i+p+1} - u_{i+1}} N_{i+1,p-1}(u)$$

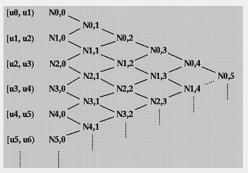

where parameter p, the degree of the basis function.

■ If p=0, all the basis functions become step functions, as indicated in the first expression. For example, consider  $u=0, u_1=1, u_2=2, u_3=3$ , and p equals zero. That is,  $N_{0,0}(u)=1$  in [0,1) and rest is zero,  $N_{1,0}(u)=1$  in [1,2) and rest is zero, etc.

[1]https://en.wikipedia.org/wiki/De\_Boor%27s\_algorithm

■ When p is greater than zero,

To calculate  $N_{i,1}(u), N_{i,0}(u), N_{i+1,0}(u)$  are required. Hence,  $N_{0,1}(u), N_{1,1}(u), N_{2,1}(u)$  can be calculated afterwards. Once, in general,  $N_{i,1}(u)$  are computed,  $N_{i,2}(u)$  can be computed and so on.

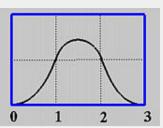

• Consider  $U = \{0, 1, 2, 3\}$ 

$$N_{i,p}(u) = \frac{u - u_i}{u_{i+p} - u_i} N_{i,p-1}(u) + \frac{u_{i+p+1} - u}{u_{i+p+1} - u_{i+1}} N_{i+1,p-1}(u)$$

$$N_{0,1}(u) = u N_{0,0}(u) + (2 - u) N_{1,0}(u)$$

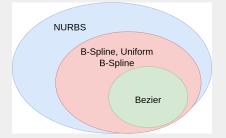

$$\vdots$$

## **B-SPLINE CURVE FITTING: PROPERTIES**

- Bezier curves do not support local modification and editing; however, **B-spline does support local editing**, i.e.,  $N_{i,p}$  is non-zero polynomial on  $[u_i, u_{i+p+1}]$
- Relationship between B-Spine, NURBS, and Bezier

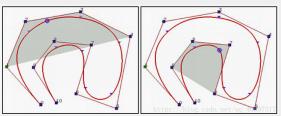

- $\blacksquare$   $N_{i,p}(u)$  is a polynomial of degree p on u
- Non-negativity for all i, p and u  $N_{i,p}(u)$  is non-negative

## **B-SPLINE CURVE FITTING:PROPERTIES**

Differentiability

$$\frac{d}{du}N_{i,p}(u) = (p-1)\left[\frac{N_{i,p-1}(u)}{u_{i+p}-u_i} - \frac{N_{i+1,p-1}(u)}{u_{i+p+1}-u_{i+1}}\right]$$

■ Convex-hull property if u is in the interval  $u_i, u_{i+1}$ , then the curve that containing control points  $P_{i-p}, P_{i-p+1}, ..., P_i$  form a convex hull

■ Will not pass through its control points

■ Generating the basis function table, knot vector with size n+p+1, where n number of control points, p is the order using **Clamped method**[1]

Set the front and rear order +1 notes 4 to zero and one For example, if the control points are given by

$$0, \frac{1}{9}, \frac{2}{9}, \frac{3}{9}, \frac{4}{9}, \frac{5}{9}, \frac{6}{9}, \frac{7}{9}, \frac{8}{9}, 1.$$

Then clamped list becomes :  $0,0,0,0,\frac{1}{3},\frac{2}{3},1,1,1,1$ .

■ Or divide uniformly, e.g., 3rd-degree spline function, where knot vector can be defined as  $t0 = -3\delta t, t1 = -2\delta t, t2 = -\delta t$  and so on

[1] Robust and Efficient Quadrotor Trajectory Generation for Fast Autonomous Flight, Boyu Zhou, Fei Gao, Luqi Wang, Chuhao Liu and Shaojie Shen, IEEE Robotics and Automation Letters (RA-L), 2019.

- Given time index t, calculate the corresponding position coordinate value or higher order values Cox-DeBoor formula [1]
- Let K be the number of control points, there are K-1 segments of trajectories, hence the domain of the 3-degree B-Spline curve is  $u_3, u_{3+k-1}$ , and there are a total of K+5 knot vectors, i.e., M=K-1+3+3, so there should be M-3 or K+2 control points

$$p(s(t)) = s(t)^{\top} M_{p_b+1} q_m$$

$$s(t) = [1 s(t) s^2(t) \dots s^{p_b}(t)]^{\top}$$

$$q_m = [Q_{m-p_b} Q_{m-p_b+1} Q_{m-p_b+2} \dots Q_m]^{\top}$$

For a small curve defined on  $t_m, t_{m+1}$  on the B-Spline curve,  $p_{m-p_b}, p_m$  determined by these four control points, where  $s(t) = \frac{t - t_m}{s_t}$ 

[1] https://en.wikipedia.org/wiki/De Boor%27s algorithm

Matrix  $M_{p_h}$  is constant matrix

$$M^{1} = [1], M^{2} = \begin{bmatrix} 1 & 0 \\ -1 & 1 \end{bmatrix}, M^{3} = \frac{1}{2!} \begin{bmatrix} 1 & 1 & 0 \\ -2 & 2 & 0 \\ 1 & -2 & 1 \end{bmatrix}$$

$$M^{4} = \frac{1}{3!} \begin{bmatrix} 1 & 4 & 1 & 0 \\ -3 & 0 & 3 & 0 \\ 3 & -6 & 3 & 0 \\ -1 & 3 & -3 & 1 \end{bmatrix}, M^{5} = \frac{1}{4!} \begin{bmatrix} 1 & 11 & 11 & 1 & 0 \\ -4 & -12 & 12 & 4 & 0 \\ 6 & -6 & -6 & 6 & 0 \\ -4 & 12 & -12 & 4 & 0 \\ 1 & -4 & 6 & -4 & 1 \end{bmatrix}$$

K. Qin, "General matrix representations for b-splines," The Visual Computer, vol. 16, no. 3, pp. 177-186, 2000

■ Calculate position constraints

$$x_i = \frac{1}{6}(Q_{i+1} - Q_i), i = 0, ..., K - 1$$

- Calculate velocity and acceleration constraints It's required to calculate the derivative with respect to time. Since s(t) is a function of t and has a constant term  $\frac{1}{\delta t}$ , first and second differentials are multiplied by  $\frac{1}{\delta t}$  and  $\frac{1}{\delta t^2}$ , respectively.
- For K number of potion constraints, two velocity constraints, and two acceleration constraints, in total K+4 constraints, are needed for K+2 control points. Hence, the process of calculating B-spline is solving Ax = b, through matrix operation.

K. Qin, "General matrix representations for b-splines," The Visual Computer, vol. 16, no. 3, pp. 177–186, 2000

Estimate velocity and acceleration

$$V_i = \frac{p_b(Q_{i+1} - Q_i)}{t_{i+p_b+1} - t_{i+1}}, \, A_i = \frac{(p_b - 1)(V_{i+1} - V_i)}{t_{i+p_b+1} - t_{i+2}}$$

Checking feasibility of velocity and acceleration

$$V_i' = \frac{1}{\mu_v} \frac{p_b(Q_{i+1} - Q_i)}{t_{i+p_b+1} - t_{i+1}} = \frac{1}{\mu_v} V_i$$

$$A_i' = \frac{1}{\mu_a} \frac{(p_b - 1)(\frac{1}{\mu_a} V_{i+1}' - \frac{1}{\mu_a} V_i')}{t_{i+p_b+1} - t_{i+2}} = \frac{1}{\mu_a^2} \frac{(p_b - 1)(V_{i+1} - V_i)}{t_{i+p_b+1} - t_{i+2}}$$
